The benefits of CI/CD

Noyan Alimov

Reduce cost

CI/CD helps developers to spend much less time on arising issues from new code by catching compile errors after merge.

This leads to reduced cost.

Avoid cost

CI/CD helps to automate infrastructure creation (compute machines, network, databases, etc).

This leads to less human error and faster deployments which in turn, helps us to avoid cost.

Reduce cost

During frequent deployments, a lot of times there are too much and unused resources.

CI/CD helps us to automate infrastructure cleanup to get rid of these unused resources.

This leads to reduced cost.

Increase revenue

CI/CD helps us achieve faster and more frequent production deployments.

New value-generating features are being released more quickly.

As a result, this increases our company's revenue.

Protect revenue

In the event of job failure (if something during deployment goes wrong), automated rollback gets triggered thanks to CI/CD.

In other words it is a quick undo to return production to it's working state.

This feature protects our revenue.
